# Network properties - threshold

- **67 M edges** and roughly **800,000 nodes**
- 99.8% of the nodes are connected in one giant component
- threshold for edges
  - $\text{dicos}(v,w) = 0.0019$
  - high clustering coefficient
  - high assortativity by degree
  - number of edges and component size

# Outline

- Introduction
- Extracting Person Mentions
- The Wikipedia Social Network
- **Community Evaluation**
- Conclusion and Ongoing Work

# Evaluation goal

- Did we choose the right threshold?
- Does the network represent meaningful relationships between persons?

# Evaluation strategy (1)

- Extract communities from the network
  - Stabilized Label Propagation Algorithm (SLPA)
  - Assign each node to the most probable community
- Compare communities against Wikipedia categories

# Evaluation strategy (2)

- A community is compared to each category of its members
  - category with highest F-score is included in the evaluation
- Comparison of the **dicos** threshold to
  - no threshold (none)
  - co-occurrence threshold of 2 (cooc)

# Community evaluation - results

- Evaluation on two different sets of communities

communities	t	#comms	#persons	F	P	R

	dicos	713	24,315	0.3889	0.4785	0.4238

# Community evaluation – discussion (1)

## Problems with **ground truth**

- No clear rules for category assignment
- Inconsistency due to large number of editors
- Lack of semantic meaning
  - e.g. categories based on same place of birth
- Hierarchical organization of categories

# Community evaluation – discussion (2)

## Problems with **evaluation**

- Person was assigned to most probable community -> very large communities
- Comparison to large categories like “Living People” (containing > 400.000 persons)
  - never receives high Precision Recall

**BUT the social network was not designed to resemble Wikipedia categories**

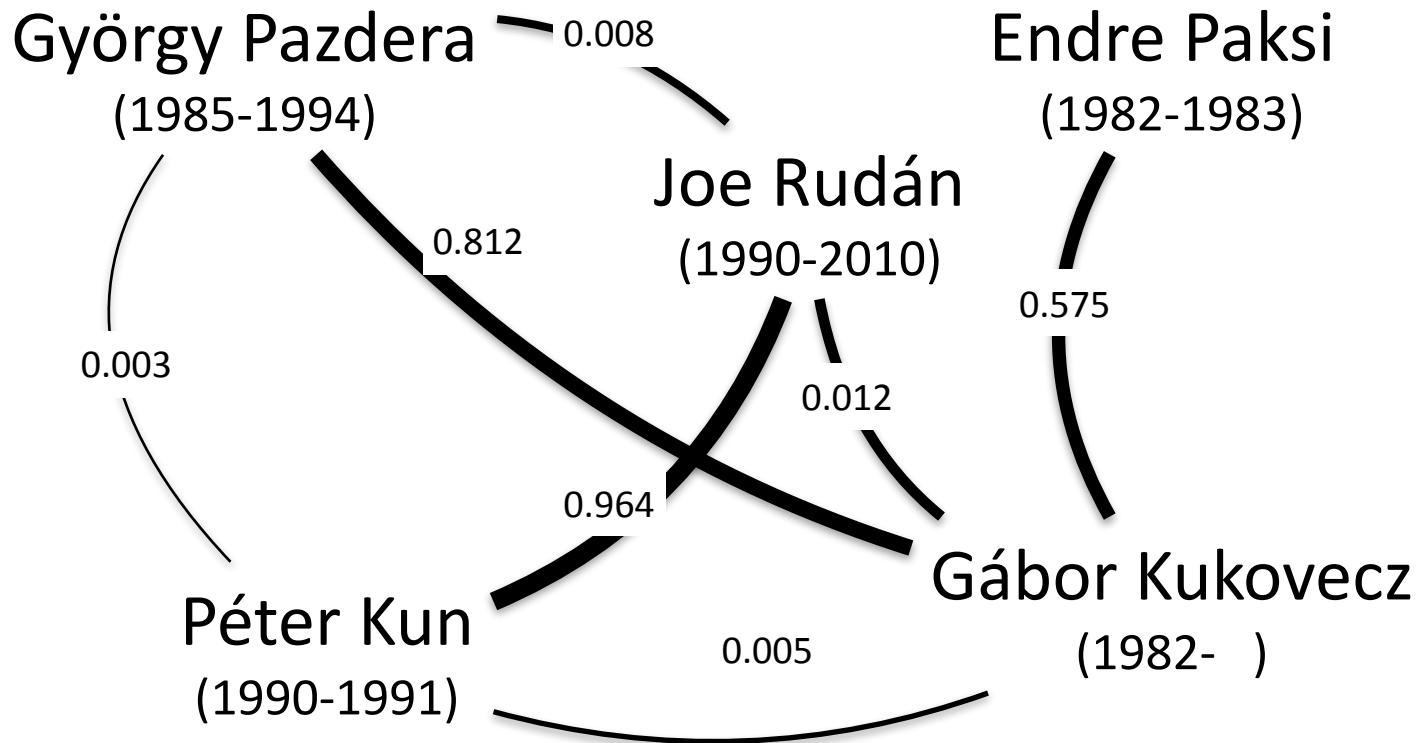

# Community evaluation – discussion (3)

Interesting groups within the network are found, they are:

- semantically very well related
- not covered by any Wikipedia category
  - ▶ crew of men's eight (1962 Commonwealth Games) (9 members)
  - ▶ members of Hungarian Heavy Metal band
  - ▶ " ... "

# Pokolgép- Hungarian Heavy Metal Band

# Finish Archers

# Evaluation - Conclusion

- WSN represents meaningful relationships
  - we find semantically very well related communities, but difficult to evaluate
- community evaluation based on Wikipedia category not optimal
- threshold with dicos weight works well
  - minimized loss of information
  - more communities are detected
- F-measure nor considerably lower

# Outline

- Introduction
- Extracting Person Mentions
- The Wikipedia Social Network
- Community Evaluation
- **Conclusion and Ongoing Work**

# Conclusion

- First framework for extracting person-centric network from unstructured data (Wikipedia)
- Heuristics for determining person mentions
- *dicos* weight for relationships
- Edge threshold based on *dicos* weight
- WSN represent valid and meaningful relationships and shows typical properties of social networks

# Ongoing work

- Find more person mentions using Stanford NER
- Add more person related information to the network (occupation, citizenship etc.)
- Apply the WSN to other tasks
  - disambiguation person names in text

Precision of 97%

# Contact and resources

johanna.geiss@informatik.uni-heidelberg.de

<http://dbs.ifi.uni-heidelberg.de/>

Wikipedia Social Network is available at:

<http://dbs.ifi.uni-heidelberg.de/index.php?id=data>

# Questions

# Additional material

# Statistics for Wikidata

- 2.6 M person entries in total
- **1.2 M** entries with **link to EN Wikipedia**
- Top 3 occupations:
  - politician (15.5%)
  - association football player (14.5% )
  - actor (7.4 % )

# Identifying person mentions – IWL (4)

- 76.8 M IWLs in EN Wikipedia
- 10.4 M IWLs refer to persons (13.6%)
- $\approx$  840,000 different persons
- TOP 5:
  - Barack Obama (11,954 IWLs)
  - George W. Bush (10,650 IWLs)
  - Napoleon ( 8,918 IWLs)
  - William Shakespeare (8,770 IWLs)
  - Adolf Hitler (8,229 IWLs)

# Network properties - Pagerank

## TOP 10 ranked persons according to pagerank

Rank	Name	Birth	Death	degree
1	<a href="#"><u>Barack Obama</u></a>	1961		1561
2	John Paul II	1920	2005	1449
3	<a href="#"><u>George W. Bush</u></a>	1946		1419
4	<a href="#"><u>Adolf Hitler</u></a>	1889	1945	1508
5	Bill Clinton	1946		1249
6	Franklin D. Roosevelt	1882	1945	1232
7	<a href="#"><u>Napoleon</u></a>	1769	1821	1572
8	Benedict XVI	1927		1142
9	Elizabeth II	1926		1217
10	Ronald Reagan	1911	2004	1130

# Community evaluation - ground truth

- categories from Wikipedia
- more than 840,000 categories for the persons in our network
- most persons  $> 1$  category
- Winston Churchill in 97 categories
- largest category „Living people“ 438,500 members

# Community detection

## Stabilized Label Propagation Algorithm (SLPA)

- edge weights are not considered
- soft clustering: multiple labels possible
  - overlapping communities
  - probability of community membership depends on label distribution
- threshold for probabilities to reduce number of communities
